Resume Analysis

As an expert Career Coach, here's an analysis of the provided resume for a Data Scientist role:

##Candidate Summary

A recent Information Technology graduate with a Bachelor of Science degree, demonstrating foundational programming skills in Python (2.7.3) and Java from academic projects. The candidate has basic Linux command-line familiarity and is actively pursuing additional Linux training. Current work experience in customer service highlights soft skills, but lacks direct data science application.

##Strengths

- Bachelor's degree in Information Technology provides a technical foundation.
- Basic Python programming experience from university projects.
- Familiarity with Linux commands and ongoing training in the OS.
- Developed strong communication and interpersonal skills through work and academic collaboration.

##Weaknesses

- Significant lack of data science-specific technical skills (e.g., machine learning, statistics, SQL, data visualization).
- Programming language versions and tools listed are outdated (e.g., Python 2.7.3, Java 7, Windows XP).
- Academic projects are general IT/CS, not focused on data analysis or predictive modeling.
- Current work history is largely irrelevant to a data science role.
- No mention of data science libraries (Pandas, Scikit-learn) or a project portfolio.

##Readiness Score

2/10. The candidate has a foundational degree and basic programming, but needs extensive training and project experience in core data science methodologies, tools, and modern technologies.

Skill Gap Analysis

Existing Skills

- Foundational programming in Python (basic), Java, C, C++
- Familiarity with Linux operating systems and basic command-line operations
- General problem-solving and debugging skills from programming projects
- Strong communication and customer service skills from work history

Missing Skills

- SQL for database querying and manipulation
- Python for data science (Pandas, NumPy, Matplotlib, Seaborn, Scikit-learn)
- Statistical concepts (hypothesis testing, regression, probability)
- Machine learning fundamentals and algorithms
- Data visualization tools (e.g., Tableau, Power BI)
- Experience with data cleaning, ETL, and data modeling
- Cloud platforms (AWS, Azure, GCP) or big data technologies (Spark)

Learning Priority

1. SQL fundamentals (joining tables, aggregate functions)
2. Python for Data Science (Pandas, NumPy for data manipulation; Matplotlib/Seaborn for visualization)
3. Applied Statistics for Data Science (descriptive, inferential statistics)
4. Machine Learning basics (supervised/unsupervised learning, model evaluation)
5. Data Visualization techniques and tools

Suggestions

- Develop a portfolio of data science projects demonstrating use of SQL, Python libraries, and statistical analysis.
- Enroll in online courses or a bootcamp focused on data science and machine learning.
- Update your Python version and showcase its application in data analysis, not just general programming.
- Network with data professionals to gain insights and potential mentorship opportunities.
- Target entry-level data analyst or business intelligence roles to build relevant experience.

Learning Roadmap
